
-- Description: Keyboard Macro Utility helps you to simplify your work by creating keyboard macros. With the help of macros you can record a series of actions on the keyboard that you perform as quickly as possible and play them back whenever you want. When you create your own macros they are stored in the registry, and then you can run them at any time by selecting them in the start menu or in the command prompt. You can also record the macros you create and store them in the registry. The Registry allows you to store your keyboard shortcuts and command-line commands in a single location and access them from all of your applications. Key Macro lets you assign macros to keys so that you can use them to perform simple tasks, like displaying the desktop or launching an application. Using Key Macro you can also create any application shortcuts that you want, because the keys assigned to macros are not stored in the registry. Keyboard Macro is a free utility that can be used for free. I have an IBM T22 and the right media keys don't work. I have tried using mediakeys and it doesn't work. I have tried the free alsacnf and it doesn't work. I have followed the instructions from the driver on the web site and it doesn't work. I have tried the wizard on the microsoft website and it doesn't work. I tried the auto installer and it didn't work. I tried various other methods of installing the drivers and still it doesn't work. It's the little master I guess. It is really a shame that they do not support the media keys on this wonderful machine. I do understand that they want to save money, but as long as they allow us to adjust the volume with the media keys it would be great. I am sure they will fix this in a future upgrade. I have an IBM T22 and the right media keys don't work. I have tried using mediakeys and it doesn't work. I have tried the free alsacnf and it doesn't work.
