Field of the Invention The present invention relates to a method of controlling a driving voltage of a liquid crystal display device, and more particularly, to a method of controlling the driving voltage of the liquid crystal display device by using a transistor using an oxide semiconductor, which is included in the liquid crystal display device, which acts as a memory device. 2. Description of the Related Art A liquid crystal display device is a flat panel display device that displays images by the variation of the optical property of the liquid crystal cell, and has advantages of light weight and low power consumption. The liquid crystal display device (LCD) is a TFT-LCD (thin film transistor-liquid crystal display), which is a representative example, and is a device for receiving a color signal. In the TFT-LCD, an active matrix substrate in which many TFTs (thin film transistors) having their source electrodes connected to an image signal line and drain electrodes connected to pixel electrodes are arranged in a matrix form, and an opposite substrate, to which a color filter is adhered, are provided, and the TFT-LCD displays images by receiving an electric field in between the two substrates. In the TFT-LCD, image data corresponding to the image signal line are applied to the TFT-LCD through the drain electrode of the TFT. The TFTs are turned on/off in accordance with the
