Feature summary Table 1 lists the major new features of AutoCAD 2017, the AutoCAD 2018 (June release), and other key AutoCAD features. (Feature descriptions from the AutoCAD 2003 and AutoCAD 2004 user manuals are included only for illustrative purposes and may differ slightly from the descriptions in this article.) Table 1. New features of AutoCAD 2017, AutoCAD 2018, and other key AutoCAD features (). (1) We use the term native data types for AutoCAD features that are the same as or similar to those of the other Autodesk software products. For example, in AutoCAD 2011, the User Data Definition Language (UDDL) supports data types defined in Microsoft's MDX format. AutoCAD for Mac (Apple Inc., Cupertino, CA) supports MDX natively. Data types are not new to AutoCAD and Autodesk's other software products. (2) AutoCAD includes a range of history lists, which allow you to review details about changes made to drawings, and about the drawing as a whole. Most history lists are accessible via the View tab of the ribbon.

Application profile (2011 and later) The application profile was released in AutoCAD 2011. A new UI for switching between different application profiles is available on top of the Ribbon, including a new tab called "Options". Application profiles Application

profiles allow AutoCAD users to customize the application to their own preferences. An application profile contains a set of user preferences, and at the time of application profile creation, the set of user preferences which it contains are loaded into the application. The set of user preferences can be subsequently modified by a user or by AutoCAD application management tools. The user preferences are stored in the workspace. A user may create a set of user preferences for one application profile, and then switch to another application profile, retaining the user preferences from the previous profile. User preferences for an application profile are assigned to a specific application profile, and if the application profile is switched, the user preferences are lost. Once a user's user preferences have been loaded in the workspace, there is no way to find out what the preferences are, and even if the user has saved the preferences to a file, they cannot be loaded back into the workspace. Application profiles can be created by the user or created by AutoCAD application management tools. The user interface for creating an application profile differs depending on the application profile being created: User interfaces for creating an application profile are available for AutoCAD Architecture and AutoCAD Electrical, which are available in the Authoring Tools application category. AutoCAD Mechanical application profiles are created using the Application Manager

application category. AutoCAD Enterprise Architect application profiles are created using the Application Manager application category. AutoCAD also provides a feature in which the user can create a profile without using the user interface. This feature, a.XPS document profile, can be used to save the user's preferences to a file which can be used in future sessions, provided the.XPS file is not updated by the user. When a user switches to a new application profile, a copy of the saved user preferences are loaded from the.XPS profile, as AutoCAD cannot recognize the original user profile. AutoCAD application profiles do not survive a computer reboot. Subscription products Subscription products are software products for the AutoCAD software, that are subscription-based and are aimed at streamlining the workflow and increasing efficiency by offering built-in capabilities.
