Category:RENAULTTechnology News KANPUR: Finding  
a pattern in the seemingly insignificant details of things  
around us has always fascinated us. An Indian-origin  
scientist from Purdue University (USA) recently  
discovered a pattern in the difference between the metric  
and non-metric systems of counting. The global population  
used to be counted in hundreds, but now it is in billions.  
Counting in billions was once unthinkable. But in the non-  
metric systems of counting, like Hausa or Yoruba counting  
system, every group has a pattern for counting. Professor  
Satyabrata Rai Chowdhury, working in Purdue University  
(USA), has discovered a pattern for counting in the non-  
metric systems of all the languages of the world. Rai  
Chowdhury and the team of researchers, had discovered  
that the grammatical forms used to represent counting  
system of all the languages of the world are based on the  
general rules of prefixation. These rules apply to the  
counting system of all the languages of the world, including  
the most widely spoken English, French, Spanish, Swahili,  
and Hausa. The scientists used to count the number of  
objects by the standard method of first counting the  
number of factors and then multiplying them. They started  
by examining the rules that govern the grammatical forms  
that represent the counting system in the non-metric system

---

of counting. They found that the counting grammatical forms are based on prefixation of the factors of the set, like  $4 + 6 + 4 = 4 + 4 + 4$ . There are also non-metric number systems in which the difference between the non-metric system and the metric system is like in the Yoruba, Hausa and the other non-metric systems of counting. Rai Chowdhury, an Indian-origin scientist working in Purdue University (USA), working on patterns in the differences between the metric and non-metric systems of counting is an Indian-origin scientist working on patterns in the differences between the metric and non-metric systems of counting. “These
